Names you can actually own

ONTs are names you can own, verify, and update. Bitcoin anchors ownership; owner-signed off-chain records keep destinations updateable; bonded auctions price scarce names without rent or third-party payments.

CORE MODEL

- | | |
|----|--------------------------------|
| 01 | Ownership
on Bitcoin |
| 02 | Records
off-chain |
| 03 | Bonds
not rent |

HOW ONE NAME RESOLVES

Alice Example

Bitcoin anchor

alice owner record

owner key: 8f3c...12ab
bond: self-custodied bitcoin

Signed off-chain bundle

alice destinations

bitcoin: bc1qxy...0wlh
lightning: ln01q...9sa
email: alice@example.com
website: alice.example

Client

resolve alice

checks Bitcoin ownership
verifies owner signature
uses website: alice.example

Bitcoin answers who owns alice. The signed off-chain bundle answers where it points.

ALLOCATION COST

Bonded Bitcoin

A bond creates real cost without paying a third party.

No payment to ONT or a registry. No burn.
No annual rent. Bitcoin remains
self-custodied.

Bonds mature after 1-3 years; pre-maturity
transfers use buyer replacement bonds.

Example opening floors

Illustrative: USD assumes ₮ 1 = \$100k

Len	Bond ₮	USD
1	1	\$100k
2	0.5	\$50k
3	0.25	\$25k
4	0.125	\$12.5k
5	0.0625	\$6.25k
6	0.03125	\$3.13k
...	...	...
12+	0.0005	\$50

NAME ALLOCATION

Public Auctions

After launch, anyone can open a public auction
for any valid name. Auctions settle with
ordinary Bitcoin transactions; destination
records stay off-chain.

- public auction window
- opening floor
- competing bids raise the bond
- winner settles owner key

If more than one participant cares about a name,
the auction discovers that.
